Finger Exercises Lecture 5

The questions below are due on Monday September 26, 2022; 03:00:00 PM.

1) Question 1 of 1

Assume you are given a string variable named `my_str`. Write a piece of Python code that prints out a new string containing the even indexed characters of `my_str`. For example, if `my_str = "abcdefg"` then your code should print out `aceg`.

```
1  # Write your code here

       my_str = input("Please provide a sequence of letters
       or a word: ")
       new_str_even_indexes = ""

       for i in range(len(my_str)):
           if i%2 == 0:
               new_str_even_indexes += my_str[i]
       print(new_str_even_indexes)
```

You have infinitely many submissions remaining.

Here is the solution we wrote:

```
s = ''
for i in range(0,len(my_str),2):
  s += my_str[i]
print(s)
```
